

Openness – what it means for academics

Judith Bishop

Microsoft Research, Redmond, USA

What is openness?

Open research

attending conferences, collaborating, internships

easy to find on a website e.g. research.microsoft.com

Cross platform software

Virtual machines on the cloud e.g. Azure

Browser-based implementations e.g. Rise4Fun, Touchdevelop

Software as a service

Open source and free software

... next ...

More about open source software

Popularity

Reliability

Adaptability

Security

Independence

Cost of
ownership

Open source in action

Use it

Everywhere because of the perceived value

Plus: it is often cross-platform

Change it

In capstone projects

Students want to get their hands on real software

They like to collaborate

In research

Small components are added to save time

Studies are done on how people work and program

Software Helps Create Sign Language Dictionaries, Voice-Activated Games for the Hearing Impaired

Carnegie Mellon Students Develop Open Source Tools With Bangalore School

BY BYRON SPICE - TUE, 2015-09-15 13:08 | 

Carnegie Mellon University's [TechBridgeWorld](#) research group today announced the release of open source software that can help educators of children with hearing disabilities create video dictionaries of sign languages and use games that encourage vocalization by children learning to speak.

The software, produced in collaboration with the [Mathru Educational Trust for the Blind](#) in Bangalore, India, is particularly suited for use in underdeveloped countries where educational resources for children with disabilities are often in short supply.

CMU students and 2015 ISTEP interns Erik Pintar, Minnar Xie, Maya Lassiter and Amal Nanavati.

Open Source at Microsoft

Microsoft uses, produces and adds to OSS extensively

We offer key company software such as DotNet and cryptography

30+ domain specific research tools, categorized in a portal

openness.microsoft.com/blog/
www.microsoft.com/opensource
research.microsoft.com/opensource

MS supports OSS

- These and many other platforms and tools are available via VMs on Azure
- Academics and classes get free access to Azure
- A movement of openness

OSS Frameworks & Tools

The graphic displays a collection of logos for various open-source technologies and frameworks. The logos are arranged in three rows. The first row includes OpenLogic (Tux penguin), SUSE (green lizard), Docker (blue whale), Engine Yard (red train engine), and Git (red diamond). The second row includes CentOS (purple flower), Ubuntu (orange circle), Tomcat (yellow cat), Eclipse (blue sphere), and Oracle (red penguin). The third row includes Hadoop (white elephant).

Open Source Software from Microsoft for Academics

Always open. Often cross platform. Try it.

Open source is a powerful way of advancing software development and sharing data for experimentation. Microsoft has open sourced research projects as well as key software such as the .NET Core. Academics are especially invited to explore the software listed here, use it their classes and research, and join in adding code to make the projects better. Our repositories contain many projects and tools. This website is a guide to those that are active and have leaders wishing to engage with academics right now.

Return to this website regularly to see new projects and announcements for collaboration.

Showcased projects

TPM Software Stack
for accessing TPM security components

Z3 Theorem Prover
for analysis, testing, and verification

.NET Core
for experimenting with real operating systems

Getting started

Microsoft Research blends software development with cutting edge research. In the Project Directory below, each project links to a website where there will be information and papers. After reading about the project, you can try out the software by downloading it from one of our repositories—GitHub, CodePlex, the Microsoft Research website, or the .NET Foundation. Then start looking at the source and adding to it.

Example Projects

The screenshot shows the Madoko editor interface. On the left, there is a code editor with the following content:

```

]quad;

]quad [- e1 : \a ]quad [- e2 : \a]
n e1 [else e2: \a]$

e for effect declarations (#subsec-typing)

type inference of Koka is presented in previous
katr;@leijen:koka}. Here we look specifically at ho
for effect declarations.

fect_. Before we look at the general type inference
rations (Figure [#fig-type-effect]) we start with
le, namely the Identity effect $!id$:

,do = a {
  nil(x) { x }
  ind(x,f) { f(x) }

```

On the right, there are type rules for explicitly typed Koka:

$$\frac{\vdash e_1 : \sigma_1 \rightarrow e_2 \quad \vdash e_2 : \sigma_2}{\vdash e_1 e_2 : \sigma_2}$$

$$\frac{(\text{TVal}) \quad \vdash e_1 : \sigma_1 \quad \vdash e_2 : \sigma_2}{\vdash \text{val } x = e_1; e_2 : \sigma_2}$$

$$\frac{(\text{TIf}) \quad \vdash e : \text{bool} \quad \vdash e_1 : \sigma \quad \vdash e_2 : \sigma}{\vdash \text{if } e \text{ then } e_1 \text{ else } e_2 : \sigma}$$

Figure 4. Type rules for explicitly typed Koka.

3.2. Type inference for effect declaration

The effect- and type inference of Koka is presented in previous work [17, 18]. Here we look specifically at type inference works for effect declarations.

The Identity Effect. Before we look at the general inference rule for effect declarations (Figure 5) we start with a concrete example, namely the identity effect:

```

effect id(x) = a {
  function unit(x) { x }
  function bind(x,f) { f(x) }
}

```
